Abstract:

The successful process of education depends in the first place on fragile and subtle interactions which are made mostly by communicable bonds between subjects. When we want to talk about interactive software, the first thing to do is to define the meaning of interactivity in education. It is, also, impossible to imagine educational software without any interactivity. Interactive-communicative aspect could be taken as one of the teaching aspects among other two: social-generational and individual aspect of personality development. The process of teaching is a creative act, whose purpose has to be fulfilled by developing the user interface of the educational software.

Key words: user interface, education, software, interactivity, child, model
